

COVID-19

— COVID DATA TRACKER WEEKLY REVIEW

Print

Interpretive Summary for **May 20, 2022**

Subscribe to the Weekly Review

It's Time for a Boost

For the week ending May 20, 2022, [cases](#) and [hospitalizations](#) continued to rise as the United States marked one million deaths from COVID-19. While about 54% of the U.S. population is experiencing low [COVID-19 Community Levels](#), many areas have moved into medium and high levels. COVID-19 Community Levels can help communities and individuals make decisions based on their local context and their unique needs.

[COVID-19 vaccination](#) remains the best option to lower your risk of severe illness, hospitalization, and death if you get infected. Many people have started vaccination, but

most have not stayed [up to date](#). About 78% of people in the United States have received at least one dose of a COVID-19 vaccine, and 66.5% are fully vaccinated. Of those who are fully vaccinated, 46.4% have received a booster and are considered up to date. Everyone ages 5 years and older is eligible to receive one booster after receiving their COVID-19 vaccine primary series. [Some people](#) are eligible to receive a second booster.

People who are up to date on vaccines have much lower risk of serious illness and death from COVID-19 compared with people who are unvaccinated. CDC's COVID Data Tracker shows that in March 2022, adults ages 18 years and older who were unvaccinated were about [5 times](#) more likely to be hospitalized with COVID-19 than those who were up to date. In the same month, people ages 12 years and older and unvaccinated were [17 times](#) more likely to die of COVID-19 than those who were up to date.

COVID-19 vaccines available in the United States are [effective](#) at protecting people from getting seriously ill, being hospitalized, and even dying—especially people who are boosted. As with other diseases, you are protected best from COVID-19 when you stay up to date with recommended vaccines. [Find a vaccine provider near you.](#)

Note to Readers: CDC will not publish the COVID Data Tracker Weekly Review on Friday, May 27, 2022. The Weekly Review will resume publication on Friday, June 3, 2022. To find all the latest COVID-19 data, visit [COVID Data Tracker](#).

What's New

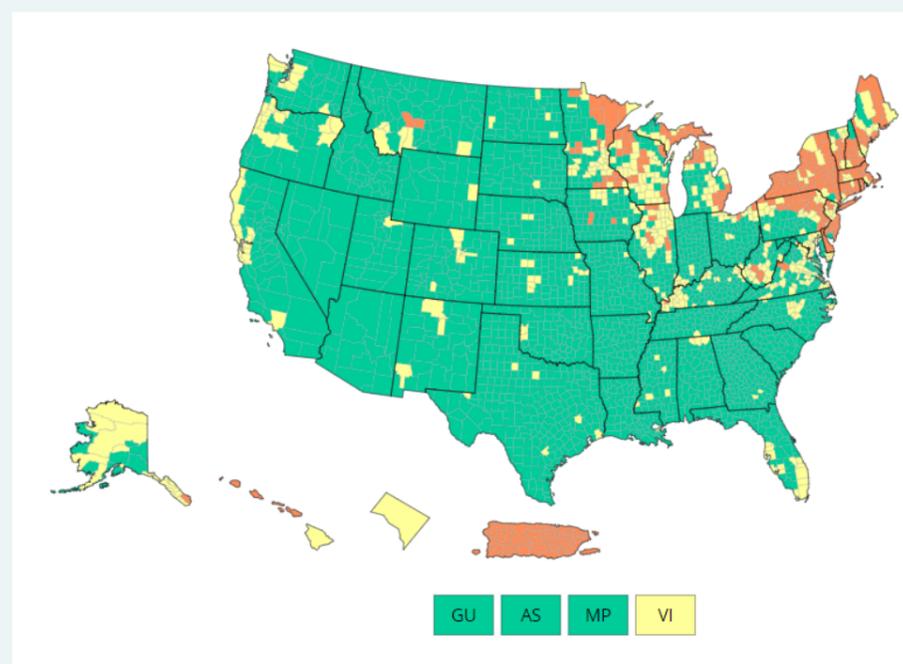

- COVID Data Tracker’s [Vaccinations in the US](#) tab now displays the count and percent of the populations ages 50 years and older and 65 years and older who have received a second booster dose, nationally and by jurisdiction. This tab also includes a new chart of the number of people in the United States with a second booster dose, by vaccine type.
- COVID Data Tracker’s [Cases and Deaths by Vaccination Status](#) tab is now updated with case data through April 23, 2022, and death data through April 2, 2022.
- [Effectiveness of a COVID-19 Additional Primary or Booster Vaccine Dose in Preventing SARS-CoV-2 Infection Among Nursing Home Residents During Widespread Circulation of the Omicron Variant — United States, February 14–March 27, 2022](#)

COVID-19 Community Levels

As of May 19, 2022, there are 301 (9.35%) counties, districts, or territories with a high COVID-19 Community Level, 477 (14.81%) counties with a medium Community Level, and 2,442 (75.84%) counties with a low Community Level. This represents a moderate (+5.10 percentage points) increase in the number of high-level counties, a slight (-0.74 percentage points) decrease in the number of medium-level counties, and a corresponding (-5.84 percentage points) decrease in the number of low-level counties. Five (9.62%) of 52 jurisdictions had no high- or medium-level counties this week.

To check your COVID-19 Community Level, visit [COVID Data Tracker](#).

Reported Cases

As of May 18, 2022, the current 7-day moving average of daily new cases (101,130) increased by 18.8% compared with the previous 7-day moving average (85,143). A total of 82,820,565 COVID-19 cases have been reported in the United States as of May 18, 2022.

CDC [Nowcast projections*](#) for the week ending May 14, 2022, estimate the combined national proportion of lineages designated as Omicron to be 100%. There are several lineages of Omicron (B.1.1.529, BA.1, BA.2, BA.3, BA.4, and BA.5), and within each are multiple sublineages. [COVID Data Tracker](#) shows the proportions of Omicron lineages grouped as follows: the B.1.1.529 lineage (includes BA.1, BA.3, BA.4 and BA.5), the BA.1.1** lineage, the BA.2 lineage, and the BA.2.12.1 lineage. The predominant Omicron lineage in the United States is BA.2. The national proportion of BA.2 is projected to be 50.9% (95% PI 44.9-56.9%). The national proportion of BA.2.12.1 is projected to be 47.5% (95% PI 41.5-53.5%). B.1.1.529 (BA.1, BA.3, BA.4 and BA.5) is

— 7-Day moving average

[View Larger](#)

More Case Data

projected to be 1.2% (95% PI 0.6-2.2%), and BA.1.1 is projected to be 0.3% (95% PI 0.2-0.4%). Omicron is predicted to be 100% in all HHS regions.

since Prior Week

**The median time from specimen collection to sequence data reporting is about 3 weeks. As a result, weighted estimates for the most recent few weeks may be unstable or unavailable. CDC's Nowcast is a data projection tool that helps fill this gap by generating timely estimates of variant proportions for variants that are circulating in the United States. View Nowcast estimates on CDC's COVID Data Tracker website on the [Variant Proportions](#) page.

**For national data, the proportion of BA.1.1 is shown separately. For regional data, the proportion of BA.1.1 is also aggregated with B.1.1.529.

***Historical cases are excluded from daily new cases and 7-day average calculations until they are incorporated into the dataset for the applicable date. Of 533,665 historical cases reported retroactively, 10,795 were reported in the current week and 5 were reported in the prior week.

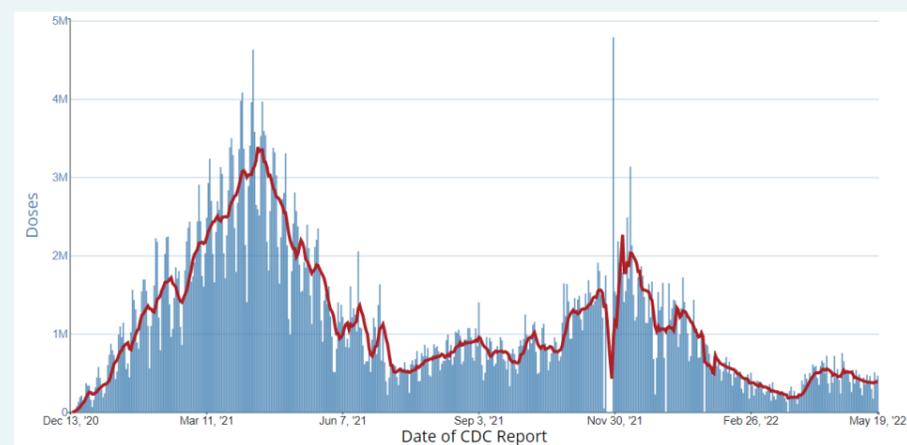

Vaccinations

The U.S. COVID-19 Vaccination Program began December 14, 2020. As of May 18, 2022, 582.8 million vaccine doses have been administered in the United States. Overall, about 258.0 million people, or 77.7% of the total U.S. population, have received at least one dose of vaccine. About 220.7 million people, or 66.5% of the total U.S. population, have been fully vaccinated.* Of those fully vaccinated, about 102.4 million people have received a booster dose,** but 49.1% of the total booster-eligible population has not yet received a booster dose. As of May 18, 2022, the 7-day average number of administered vaccine doses reported (by date of CDC report) to CDC per day was 388,308, a 0.5% decrease from the previous week.

CDC's COVID Data Tracker displays vaccination trends by age group, race/ethnicity, and urban/rural status. To see trends by age group and race/ethnicity, visit the [Vaccination Demographic Trends](#) tab. To see trends by urban/rural status, visit [the COVID-19 Vaccination Equity](#) tab.

*Represents the number of people who have received the second dose in a two-dose COVID-19 vaccine series (such as the [Pfizer-BioNTech](#) or [Moderna](#) vaccines) or one dose of the single-shot [Johnson & Johnson's Janssen](#) vaccine.

**Represents the number of people who are fully vaccinated and have received another dose of COVID-19 vaccine since August 13, 2021. This includes people who received their first additional dose or booster.

Hospitalizations

New Hospital Admissions

The current 7-day daily average for May 11–17, 2022, was 3,250. This is a 24.2% increase from the prior 7-day average (2,617) from May 4–10, 2022.

Daily Trends in Number of New COVID-19 Hospital Admissions in the United States

[View Larger](#)

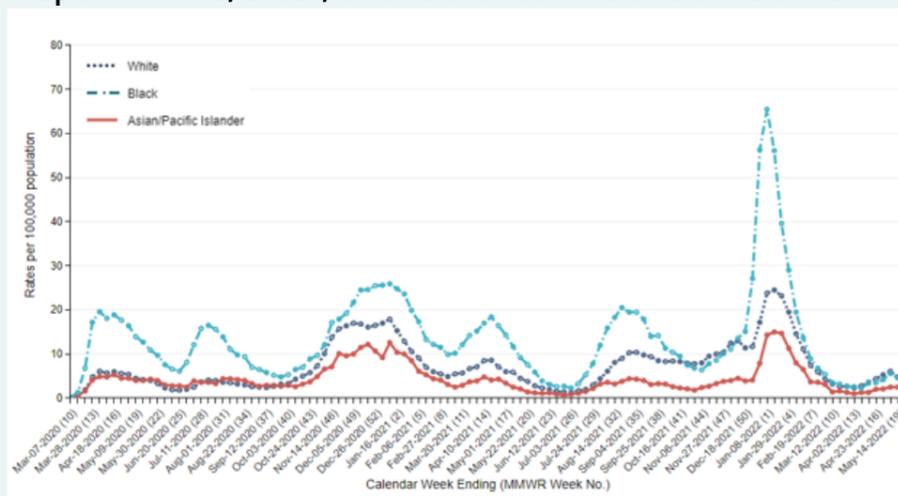

New admissions are pulled from a 10 am EDT snapshot of the HHS Unified Hospital Data – Analytic Dataset. Due to potential reporting delays, data from the most recent 7 days, as noted in the figure above with the grey bar, should be interpreted with caution. Small shifts in historic data may also occur due to changes in the Centers for Medicare & Medicaid Services (CMS) Provider of Services file, which is used to identify the cohort of included hospitals.

COVID-NET: Hospitalization Rates among Certain Racial and Ethnic Groups

CDC's [Coronavirus Disease 2019-Associated Hospitalization Surveillance Network \(COVID-NET\)](#) shows that overall rates of COVID-19-associated hospitalizations have increased more sharply within certain racial and ethnic groups. The largest increase was seen among non-Hispanic White persons when rates increased from 2.3 per 100,000 population for week ending April 2 to 5.3 per 100,000 population for the week ending May 7, 2022. Rates among non-Hispanic Black persons also increased, from 2.3 per 100,000 population on April 2 to 4.2 per 100,000 population on May 7. Additionally, rates among non-Hispanic Asian and Pacific Islander persons have increased from 1.0 per 100,000 population on April 2 to 2.1 per 100,000 population on May 7.

Rates of COVID-19-Associated Hospitalizations among non-Hispanic White, Black, and Asian/Pacific Islander Persons

[View Larger](#)

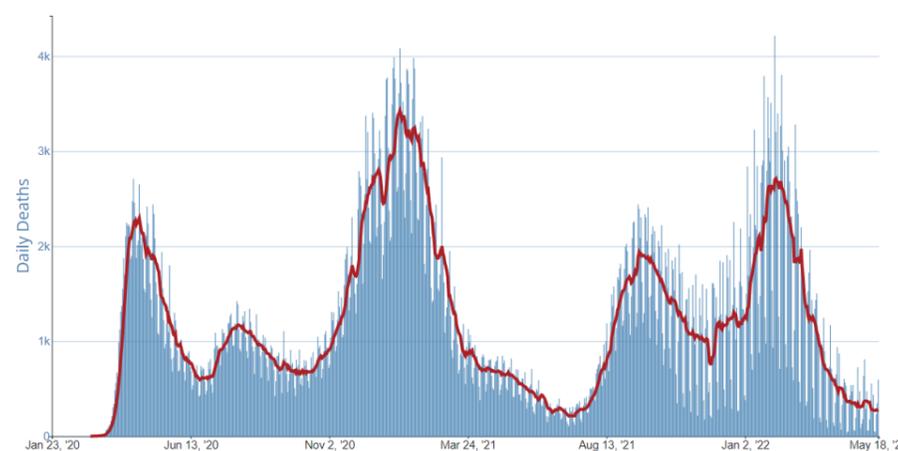

The Coronavirus Disease 2019 (COVID-19)-Associated Hospitalization Surveillance Network (COVID-NET) is an additional source for hospitalization data collected through a network of more than 250 acute-care hospitals in 14 states (representing ~10% of the U.S. population). Detailed data on patient demographics, including race/ethnicity, underlying medical conditions, medical interventions, and clinical outcomes, are [collected using a standardized case reporting form](#).

Deaths

The current 7-day moving average of new deaths (280) has decreased 1.2% compared with the previous 7-day moving average (284). As of May 18, 2022, a total of 998,512 COVID-19 deaths have been reported in the United States.

Wastewater Surveillance

COVID Data Tracker's [Wastewater Surveillance](#) tab tracks levels, changes, and detections of SARS-CoV-2* viral RNA in wastewater at nearly 900 testing sites across the country.

Currently, most of the country is reporting moderate SARS-CoV-2 levels in wastewater. Around 27% of sites are currently seeing some of the highest levels for those sites since December 1, 2021. More than half of all sites reporting wastewater data are experiencing a modest increase in SARS-CoV-2 levels, but about a quarter of sites are reporting a decrease in SARS-CoV-2 levels in wastewater. It's important to note that even a small increase when levels are low can appear like a dramatic increase in the percent change. For more information on how to use wastewater data, visit [CDC's website](#).
